Complete the function $solveMeFirst$ to compute the sum of two integers.

### Example

$a = 7$

$b = 3$

Return $10$.

### Function Description

Complete the $solveMeFirst$ function with the following parameters:

- $int\ a$: the first value
- $int\ b$: the second value

Returns

- $int$: the sum of $a$ and $b$

### Constraints

$1 \leq a, b \leq 1000$

### Sample Input

```
a = 2
b = 3
```

### Sample Output

```
5
```

### Explanation

$2 + 3 = 5$.

Change Theme Language Python 3

```python
def solveMeFirst(a, b):
    return a + b

if __name__ == "__main__":
    a = int(input().strip())
    b = int(input().strip())
    print(solveMeFirst(a, b))
```

Alice and Bob each created one problem for HackerRank. A reviewer rates the two challenges, awarding points on a scale from 1 to 100 for three categories: problem clarity, originality, and difficulty.

The rating for Alice's challenge is the triplet a = (a[0], a[1], a[2]), and the rating for Bob's challenge is the triplet b = (b[0], b[1], b[2]).

The task is to calculate their comparison points by comparing each category:

- If a[i] > b[i], then Alice is awarded 1 point.
- If a[i] < b[i], then Bob is awarded 1 point.
- If a[i] = b[i], then neither person receives a point.

**Example**

a = [1, 2, 3]

b = [3, 2, 1]

- For elements *0*, Bob is awarded a point because a[0] < b[0].
- For the equal elements a[1] and b[1], no points are earned.
- Finally, for elements 2, a[2] > b[2] so Alice receives a point.

The return array is [1, 1] with Alice's score first and Bob's second.

**Function Description**

Complete the function compareTriplets with the following parameter(s):

- int a[3]: Alice's challenge rating
- int b[3]: Bob's challenge rating

**Returns**

- int[2]: the first element is Alice's score and the second is Bob's score

**Input Format**

The first line contains 3 space-separated integers, a[0], a[1], and a[2], the respective values in triplet a.

The second line contains 3 space-separated integers, b[0], b[1], and b[2], the respective values in triplet b.

**Constraints**

- 1 ≤ a[i] ≤ 100
- 1 ≤ b[i] ≤ 100

**Sample Input 0**

```
5 6 7
3 6 10
```

Change Theme Language Python 3

```python
def compareTriplets(a, b):
    alice_score = 0
    bob_score = 0

    for i in range(3):
        if a[i] > b[i]:
            alice_score += 1
        elif a[i] < b[i]:
            bob_score += 1

    return [alice_score, bob_score]

# Taking input
a = list(map(int, input().split()))
b = list(map(int, input().split()))

# Getting result
result = compareTriplets(a, b)

# Printing output
print(result[0], result[1])
```

Line: 22 Col: 28

You have earned 10.00 points!

You are now 9 points away from the 1st star for your problem solving badge.

In this challenge, you need to calculate and print the sum of elements in an array, considering that some integers may be very large.

**Function Description**

Complete the $aVeryBigSum$ function with the following parameter(s):

- $int\ ar[n]$: an array of integers

**Return**

- $long$: the sum of the array elements

**Input Format**

The first line of the input consists of an integer $n$.

The next line contains $n$ space-separated integers contained in the array.

**Output Format**

Return the integer sum of the elements in the array.

**Constraints**

$1 \leq n \leq 10$

$0 \leq ar[i] \leq 10^{10}$

**Sample Input**

```
STDIN                                        Function
-----                                        --------
5                                           arr[] size n = 5
1000000001 1000000002 1000000003 1000000004 1000000005  arr[...]
```

**Output**

```
5000000015
```

**Note:**

The range of the 32-bit integer is $(-2^{31})\ to\ (2^{31}-1)\ or\ [-2147483648, 2147483647]$.

When we add several integer values, the resulting sum might exceed the above range. You might need to use long int C/C++/Java to store such sums.

```python
def aVeryBigSum(arr):
    return sum(arr)

# Input
n = int(input())
arr = list(map(int, input().split()))

# Output
print(aVeryBigSum(arr))
```

Line: 9 Col: 24
